| Maximum Marks | 5 Marks |

By using stories in Tableau, you can effectively communicate complex data in a way that is both interactive and engaging, making it easier for the audience to follow along and understand the insights. It's a tool for **data storytelling**, allowing you to present insights in a cohesive, engaging way that takes viewers through a logical progression of findings or analyses.

In Tableau, **Story** is a feature that allows you to create a sequence of dashboards, visualizations, and text to present data insights in a cohesive and narrative-driven way. It's like a slideshow within Tableau that guides the audience through a series of data points, helping them understand key insights, trends, or outcomes of your analysis.

Observations:

- **Balanced Population:**No age group is larger than 20.4% of patients, so the findings are not driven by one age group.
- **Blood Pressure Is High Everywhere:**Average blood pressure is between 133.6 and 135.7 mmHg for all age groups, only about 2 mmHg apart.
- **Counts vs Rates:**Heart disease and diabetes counts are highest in the Normal and Overweight BMI groups because they have the most patients, but the heart disease rate is highest in the Obese group (40.0%).
- **Exercise and BMI Together:**Obese and Sedentary patients have the highest heart disease rate (42.9%), and rates fall as activity increases in the Obese group (39.9% moderate, 37.7% active).
- **Fatigue:** Between 397 and 521 patients in every age group report fatigue, and the Teenager group has the most (521).

## Activity 2:

Publish Story on Tableau Public and Paste Public link below
