Scalability & Future Plan

Date	01 November 2026
Team ID	
Project Name	Health360: Comprehensive Healthcare Risk & Disease Analysis
Maximum Marks	1 Mark

Scalability & Future Plan:

This document outlines how the Health360 solution can be scaled to handle more data and users, and the roadmap for enhancing it.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address (High / Medium / Low)
1	Data comes from one static CSV file with 5,000 rows.	Dashboard does not update automatically when data changes.	High
2	The dataset looks synthetic and has a constant health_risk_score column.	Findings show association in sample data, not clinical evidence.	High
3	Tableau Public workbooks are public and the Flask app runs locally.	Not suitable for real patient data and not available to other users online.	Medium

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Flask app runs locally; Tableau Public hosts the viz.	Deploy the Flask app on a cloud host and use Tableau Server or Cloud for many users.
2	Data Storage	Single CSV file.	Move data to a database or data warehouse with a live or scheduled connection.
3	Performance	Small dataset with a fixed-size dashboard.	Use Tableau extracts, aggregate data at the source and limit filters per view.
4	Security	Public dashboard, no login.	Use private hosting with user login and only de-identified data.

Future Roadmap:

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 2	Add gender and symptom filters, chart tooltips and a downloadable summary.	Within 1 month	Easier exploration and sharing
Phase 3	Add a Python model that predicts patient risk.	Within 3 months	Early warning for high-risk patients
Phase 4	Connect to a live database and deploy online with secure login.	Within 6 months	Always-current dashboard for real users
